

### Amendments to the Claims:

Rewrite the claims as set forth below. This listing of claims will replace all prior versions and listings, of claims in the application:

### Listing of Claims:

1. (currently amended) A method for removing image compression artifacts comprising:

(a) comparing a center pixel value with a perimeter pixel value to generate a compare pixel value;

(b) when the compare pixel value is below a threshold value:

(b1) incrementing a count value; and

(b2) incrementing an accumulation value;

(c) repeating (a) through (b) for each of a plurality of perimeter pixel values; and

(d) generating an output center pixel value, wherein:

(d)(1) if the count value has been incremented in (b), the output center pixel value is based on the count value and the accumulation value without using the center pixel value[[],]; and

(d)(2) if the count value has not been incremented in (b), the output center pixel value is equivalent to the center pixel value.

2. (cancelled)

3. (currently amended) The method of claim 1 wherein (a) further ~~comprising~~comprises:

(a1) calculating the difference between the center pixel value and the perimeter value;  
and

(a2) calculating the absolute value of the difference of (a1).

4. (previously presented) The method of claim 1 wherein (d1) further comprises generating the output center pixel value as the accumulation value divided by the count value.

5. (original) The method of claim 1 wherein the threshold value defines an edge.

6. (previously presented) The method of claim 1 wherein (a) through (d) are performed once per color in a color scheme.

7. (currently amended) The method of claim [[2]] further comprising[[(:)] (e) providing the output center pixel value to a frame buffer.

8. (currently amended) The method of claim 7 further comprising:

(f) repeating (a) through (e) for each of the plurality of pixels of an image except for a plurality of image perimeter pixels; and

(g) generating an output image frame including the image perimeter pixels and the plurality of output center pixel values.

9. (currently amended) The method of claim 8 further comprising[[(:)] (h) providing the output image frame to a display device.

10. (currently amended) The method of claim 8 further comprising[[:]] (h) providing the output image frame to a compression engine.

11. (previously presented) An apparatus for removing image compression artifacts comprising:

a comparator operably coupled to receive a threshold value;

an accumulator and a counter, the accumulator and the counter operably coupled to the comparator such that the accumulator is operative to receive an accumulation value and the counter is operative to receive a counter ~~value; value, wherein the~~ comparator is operative to receive a center pixel value and a perimeter pixel value such that the comparator is operative to generate a compare pixel value as the difference between the perimeter pixel value and the center pixel value and operative to compare the compare pixel value with the threshold value such that when the compare pixel value is below the threshold value, the comparator is operative to increment the count value and increment the accumulation value; and

an output pixel generator operatively coupled to the accumulator and the counter wherein the output pixel generator is operative to generate an output center pixel value, wherein if the counter value has not been incremented, the output center pixel value is the center pixel value ~~if the counter value has not been incremented~~ and if the counter value has been incremented, the output center pixel value is the accumulation value divided by the count value.

12. (cancelled)

13. (currently amended) The apparatus of claim ~~[[12]]~~11 further comprising[[:]] a pixel divider operably coupled to the comparator and the output pixel generator, wherein the

pixel divider is operative to provide the center pixel value to the comparator and the output pixel ~~generator~~generator, and the pixel divider is further operative to provide the perimeter pixel to the comparator.

14. (currently amended) The apparatus of claim 13, ~~wherein further comprising:~~ the pixel divider is further operative to receive pixel information from an image source.

15. (currently amended) The apparatus of claim ~~[[12]]~~11 further comprising~~[[:]]~~ a frame buffer operably coupled to the output pixel ~~generator~~generator, wherein the frame buffer is operative to receive the output center pixel and store the output center pixel therein.

16. (currently amended) The apparatus of claim 15 ~~wherein further comprising:~~ the frame buffer is operably coupleable coupled to a compression engine such that an image frame may be provided ~~thereto~~ to the compression engine.

17. (currently amended) The apparatus of claim 15 ~~wherein further comprising:~~ the frame buffer is operably coupleable coupled to a display device such that an image frame may be provided ~~thereto~~ to the display device.

18.-21 (cancelled)

22. (currently amended) An apparatus for removing image compression artifacts comprising:

a memory device storing a plurality of executable instructions; and

a processor operably coupled to the memory device such that the processor, in response to the executable instructions:

(a) compares a center pixel value with a perimeter pixel value to generate a compare pixel value;

(b) when the compare pixel value is below a threshold value:

(b1) increments a count value; and

(b2) increments an accumulation value;

(c) repeats (a) through (b) for each of a plurality of perimeter pixel values; and

(d) generates an output center pixel value, wherein:

(d)(1) if the count value has been incremented in (b), the output center pixel value is based on the count value and the accumulation value without using the center pixel value[[,]]; and

(d)(2) if the count value has not been incremented in (b), the output center pixel value is equivalent to the center pixel value.

23. (cancelled)

24. (original) The apparatus of claim 22, the processor further in response to executable instructions:

(a1) calculates the difference between the center pixel value and the perimeter value; and

(a2) calculates the absolute value of the difference of (a1).

25. (original) The apparatus of claim 22 wherein the processor in response to the executable instructions, generates the output center pixel value as the accumulation value divided by the count value.

26. (currently amended) A method for removing image compression artifacts comprising:

(a) comparing a center pixel value with a perimeter pixel value to generate a compare pixel value;

(b) when the compare pixel value is below a threshold value:

(b1) incrementing a count value; and

(b2) incrementing an accumulation value;

(c) repeating (a) through (b) for each of a plurality of perimeter pixel values thereby creating a corresponding plurality of compare pixel values; and

(d) generating an output center pixel value, wherein:

(d)(1) if the count value has been incremented in (b), the output center pixel value is based on the compare pixel values that are below the threshold value without using the center pixel value; and

(d)(2) if the count value has not been incremented in (b), the output center pixel value is equivalent to the center pixel value.

27. (new) The method of claim 1, wherein:

the center pixel value is associated with a center pixel and each of the plurality of perimeter pixel values is associated with respective perimeter pixel in a plurality of perimeter pixels,

each of the center pixel and the plurality of perimeter pixel values is associated with a color model having multiple components, and

each of the center pixel value and the plurality of pixels is associated with a single component of the color model.

28. (new) The apparatus of claim 11, wherein:

the center pixel value is associated with a center pixel and each of the plurality of perimeter pixel values is associated with respective perimeter pixel in a plurality of perimeter pixels,

each of the center pixel and the plurality of perimeter pixel values is associated with a color model having multiple components, and

each of the center pixel value and the plurality of pixels is associated with a single component of the color model.

29. (new) The apparatus of claim 22, wherein:

the center pixel value is associated with a center pixel and each of the plurality of perimeter pixel values is associated with respective perimeter pixel in a plurality of perimeter pixels,

each of the center pixel and the plurality of perimeter pixel values is associated with a color model having multiple components, and

each of the center pixel value and the plurality of pixels is associated with a single component of the color model.

30. (new) The method of claim 26, wherein:

the center pixel value is associated with a center pixel and each of the plurality of perimeter pixel values is associated with respective perimeter pixel in a plurality of perimeter pixels,

each of the center pixel and the plurality of perimeter pixels is associated with a color model having multiple components, and

each of the center pixel value and the plurality of pixel values is associated with a single component of the color model.
